E-Moodles Plug-In
Shani Shalel, Shirel Israelov, ShaniHayik

We created Plug-In that connects our email to the Moodle forum.
By sending Email to the specific address that every course will have you will be able to send a direct message to the forum . In this file we will explain what are the specific steps you should do to install and start using our Plug-In.

1. Open Gmail address- first you should open gmail account so the plug-in will use it as the email address for all the mail he will get.
   ● notice that the IMAP and the POP is enabled on the settings.

2. Download the script of the Plug-In.
3. Change the mail address and the password on the script. as shown below:

```
$gmail_username='emoodlesmessage';
$gmail_address ='emoodlesmessage@gmail.com';
$gmail_password='moodle1234';
```

5.Change the DB settings to your settings on the script . as shown below:

```
//your DB
$hostname_DB='127.0.0.1';
$username_DB='root';
$DB='moodle1';
$password_DB='shani3003';
$port_DB='3306';
```

4. Add the script to the Task Scheduler:
   ● Open up notepad, add this command, with your own attributes:
     "PATH_TO_PHP.EXE" -f "SCRIPT_TO_RUN.PHP"
     "PATH_TO_PHP.EXE" should be the path to the php.exe

     [So it may look like this: "C:\Program Files (x86)\PHP\v5.3\php.exe" -f "C:\emoodles_plugin\gmail.php")]
   ● Save this file as a .bat file (Batch file).
   ● Open up Task Scheduler
   ● Create a task.
   ● Give it a name, Create a **trigger** and check the daliy option.
   ● Now go to the Actions tab, hit New and it should say 'Start a program' by default.
   ● Browse to the batch file that you just made, click OK and you're done.
